## ! sting of Claims

- (currently amended) A computerized method to recover session information and data after
- a thange in a network, the method comprising:

connecting a persistent data object to a first persistent data control object;
transacting data in a data area in response to a request by the persistent data object,
with the first persistent data control object controlling the transaction of the data in the data
a ca;

dynamically replicating the data area in at least one a plurality of alternate persistent d. ta control objectobjects located anywhere in the network; and

connecting the persistent data object to an alternate persistent data control object upon notification of the change in the system, with the alternate persistent data control object obtaining control of the transaction of the data in the data area upon the change in the retwork.

- 2 (currently amended) The method of claim 1, wherein the systemnetwork comprises an Application comprised of objects, a System Registry, and a Messaging Scheme.
- 3. (currently amended) The method of claim 1 wherein the change in the systemnetwork c mprises a failure of the first persistent data control object.
- 4. (previously presented) The method of claim 1, the method further comprising creating a d ta area in response to a request by the persistent data object, with the first persistent data c ntrol object controlling the creation of the data area.
- 5. (previously presented) The method of claim 1, the method further comprising connecting the persistent data object to a second persistent data control object.
- 6 (previously presented) The method of claim 1, the method further comprising storing the c ta area in a media device.

- 7 (original) The method of claim 6, wherein the media device is chosen from the list consisting of a memory, hard disc drive, and a networked media device.
- 8. (original) The method of claim 1, wherein session information is stored in the first persistent data control object and replicated in alternate persistent data control objects.
- 9. (cancelled)
- 10. (cancelled)
- after a change in a network, the method comprising:

  connecting a persistent data object to a first persistent data control object;

  transacting data in a data area in response to a request by the persistent data object,

  with the first persistent data control object controlling the transaction of the data in the data

  area;

  dynamically replicating the data area in at least one alternate persistent data control

  object located in the network; and

  connecting the persistent data object to an alternate persistent data control object upon

  notification of the change in the system, with the alternate persistent data control object

  change on the change in the system, with the data area upon the change in the

  network;

  wherein the connecting the persistent data object to an alternate persistent data control

e yiect additionally comprises negotiating the alternate persistent data control object; and The

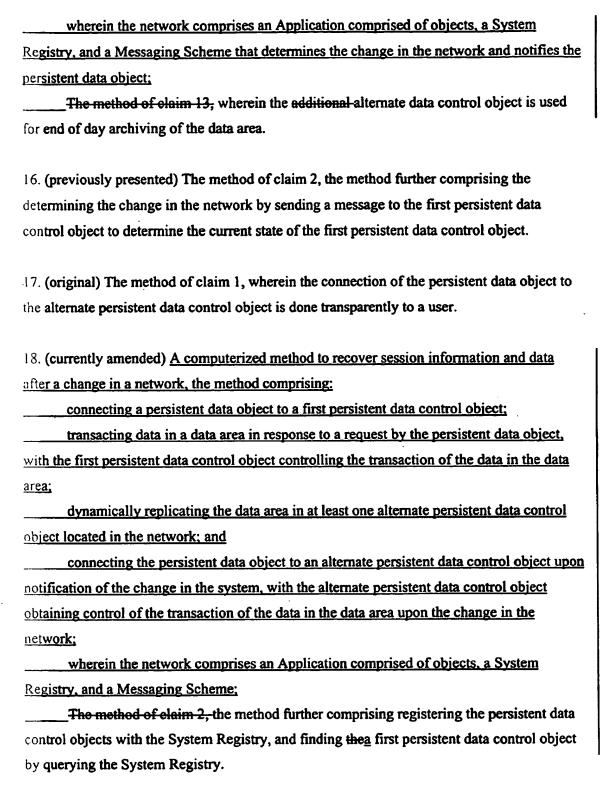

13. (previously presented) The method of claim 2, the method further comprising the persistent data object communicating with the first persistent data control object and the alternate persistent data control object through the Messaging Scheme.

method of claim-10, wherein the negotiating the alternate persistent data control object

comprises using a name-based negotiating method.

## 13. (cancelled)

14. (currently amended) A computerized method to recover session information and data
after a change in a network, the method comprising:
connecting a persistent data object to a first persistent data control object;
transacting data in a data area in response to a request by the persistent data object,
with the first persistent data control object controlling the transaction of the data in the data
area;
dynamically replicating the data area in at least one alternate persistent data control
cbject located in the network; and
connecting the persistent data object to an alternate persistent data control object upon
notification of the change in the system, with the alternate persistent data control object
obtaining control of the transaction of the data in the data area upon the change in the
network;
The method of claim-1, wherein the change in the systemnetwork-additionally
comprises adding an additional alternate data control object.
15. (currently amended) A computerized method to recover session information and data
after a change in a network, the method comprising:
connecting a persistent data object to a first persistent data control object;
transacting data in a data area in response to a request by the persistent data object,
with the first persistent data control object controlling the transaction of the data in the data
area;
dynamically replicating the data area in at least one alternate persistent data control
object located in the network; and
connecting the persistent data object to an alternate persistent data control object upon
notification of the change in the system, with the alternate persistent data control object
chtaining control of the transaction of the data in the data area upon the change in the
network;

- 19. (previously presented) The method of claim 1, the method further comprising requesting a transaction of data in the data area by a user, with the user sending the request to the persistent data object.
- 20. (original) The method of claim 19, wherein the user is selected from the list consisting of a person, a program, a person using a program, a program using a program, and expanding levels of programs using programs.
- 21. (cancelled)
- 22. (currently amended) A computer system for recovering session information and data after a change in a network, the method comprising:

a computer, with the computer including a memory and a processor; and executable software residing in the computer memory with the software being operative with the processor to:

connect a persistent data object to a first persistent data control object;

transact data in a data area in response to a request by the persistent data object, with the first persistent data control object controlling the transaction of the data in the data area;

dynamically replicate the data area in at least onea plurality of alternate persistent data control objects; and

notification of the change in the network, with the alternate persistent data control object obtaining control of the transaction of the data in the data area upon the change in the networksystem.

23. (currently amended) A computer data signal embodied in a digital data stream for recovering session information and data after a change in a network, with the computer data signal being generated by a method comprising the steps of:

connecting a persistent data object to a first persistent data control object;

area;
dynamically replicating the data area in at least onea plurality of alternate persistent

data control objects; and

with the first persistent data control object controlling the transaction of the data in the data

transacting data in a data area in response to a request by the persistent data object,

connecting the persistent data object to an alternate persistent data control object upon notification of the change in the network, with the alternate persistent data control object obtaining control of the transaction of the data in the data area upon the change in the <a href="networksystem">networksystem</a>.
